

Very High Risk Category

Quattro Plus

The Quattro Plus is a mattress replacement system for patients at very high risk of developing pressure ulcers and to manage existing pressure damage.

The active 1-in-4 alternating air cell cycle supports 75% of the patient's body at all times on groups of three inflated cells. The fourth cell deflates sufficiently to redistribute

pressure and encourage tissue reperfusion. The patient is more comfortable and less aware of the movement of the support surface.

The **orthodifferential support (ODS™)** feature provides optimum internal cell pressures to accommodate varying body weights and shapes by supporting smaller, lighter patients on the softer central area of the cell and larger, heavier patients on the firmer outer edges as well as providing a feeling of security for the patient.

- Active 1-in-4 cell cycle
- Ortho-Differential Support results in firmer outer edge
- Multi-Stretch cover with welded seams
 - waterproof | moisture-vapour permeable
- Microclimate management - "low air loss" feature reduces moisture build-up & lowers humidity level
- Fully launderable - reduce risk of cross contamination
- CPR Function - rapid deflation valve removes air from mattress to enable CPR procedures
- Transport Facility - unpowered support up to 4 hours

TISSUEgard™ air cell technology enables partial immersion and envelopment into the support surface reducing the pressure on the patient's skin and decreasing the pressure differential between inflated and deflated cells to help reduce tissue strain and associated shearing forces.
