

BRO 3128 Knee Walker

The knee walker is an excellent alternative to crutches or traditional walkers. Intended to support the leg below the knee in patients who are not able to weight bear due to lower limb injury or who are recovering from surgery.

With front steerable castors and dual handbrakes, the knee walker provides manoeuvrability but prevents back and shoulder muscle strain regularly associated with conventional crutch use.

The contoured knee pad and handlebar height can be adjusted without needing to use tools to easily allow the knee walker to be set up to ensure maximum user comfort. It also folds down for easy transport and storage.

- Durable moulded orthopaedic handgrips
- Lightweight alloy frame
- 20cm castors - suitable for indoor and outdoor use
- Steerable front castors
- Moulded seamless padded knee support
- Compact fold down design
- Removable basket and bag
- Tool free height adjustment and folding

Tool-free height adjustable orthopaedic handles with handbrakes

Seamless contoured, knee support with padding
